

# Ring Carrier Web 2.0

**The most advanced way to provide hosted or onsite services to your customers!**

Ring Provider™ is an open source based soft switch and application server solution that offers you unprecedented revenue generating opportunities. Ring Provider is all you need to to immediately launch your private labeled VoIP business for

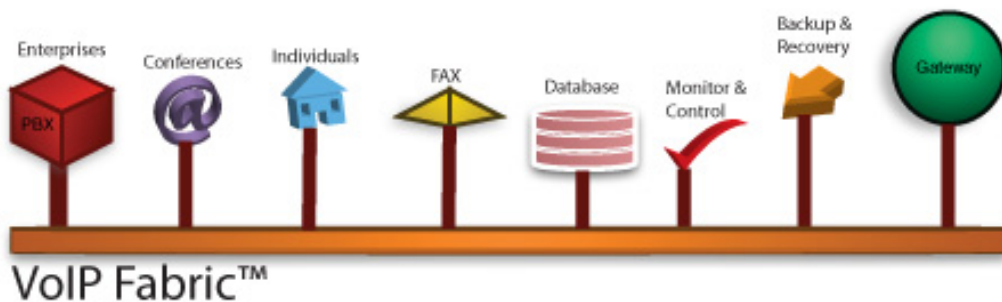

- ✚ Enterprises
- ✚ Residential Customers
- ✚ Conferencing Services
- ✚ Fax Services

Ring Provider is a turnkey end-to-end solution with low CAPEX and OPEX. Ring Provider is built with open source and open standards. Ring Provider does much more than competing systems for a small fraction of the cost.

Building blocks provide hosted PBXs, faxing, and conferencing. Building blocks run on the VoIP Fabric. Fabric management is easy.

**The VoIP Fabric lets you host thousands of building blocks.**

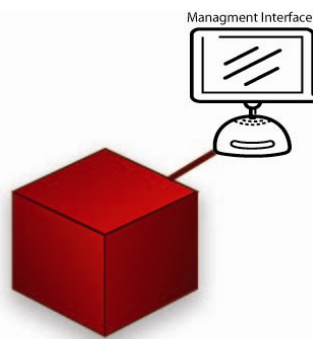

The PBX Fabric maximizes performance and minimizes your hardware costs. For example, if you have 200 enterprises with ten

users in each enterprise and 20% call utilization you must support 400 simultaneous calls. You can do

this with a single Ring Carrier server.

One Ring Carrier server can support hundreds of enterprise PBXs. Start with a hosted PBX Building Block™. A PBX Building Block is a complete hosted Asterisk PBX for an enterprise customer.

The PBX Building Block includes a Web management GUI for the enterprise administrator and an end user heads up display.

PBX Building Block™

Create a new PBX building block for an enterprise customer in seconds. Monitor your systems. Backup building blocks. Copy building blocks between servers.

You can easily move a hosted Building Block to a dedicated server and install the server at the customer location. You can retain a hosted copy of the Building Block to provide backup or extra services.
